# Traceability Link Recovery between Documentation & Code

## Software Architecture Documentation (SAD)

The **controller** receives incoming requests and verifies them.

Then, it answers requests by querying the **persistence component**.

## Code

```
package service  
class Controller {
```

```
...
```

```
}
```

```
package dataaccess
```

```
class Products {
```

```
...
```

```
}
```

```
class Users {
```

```
...
```

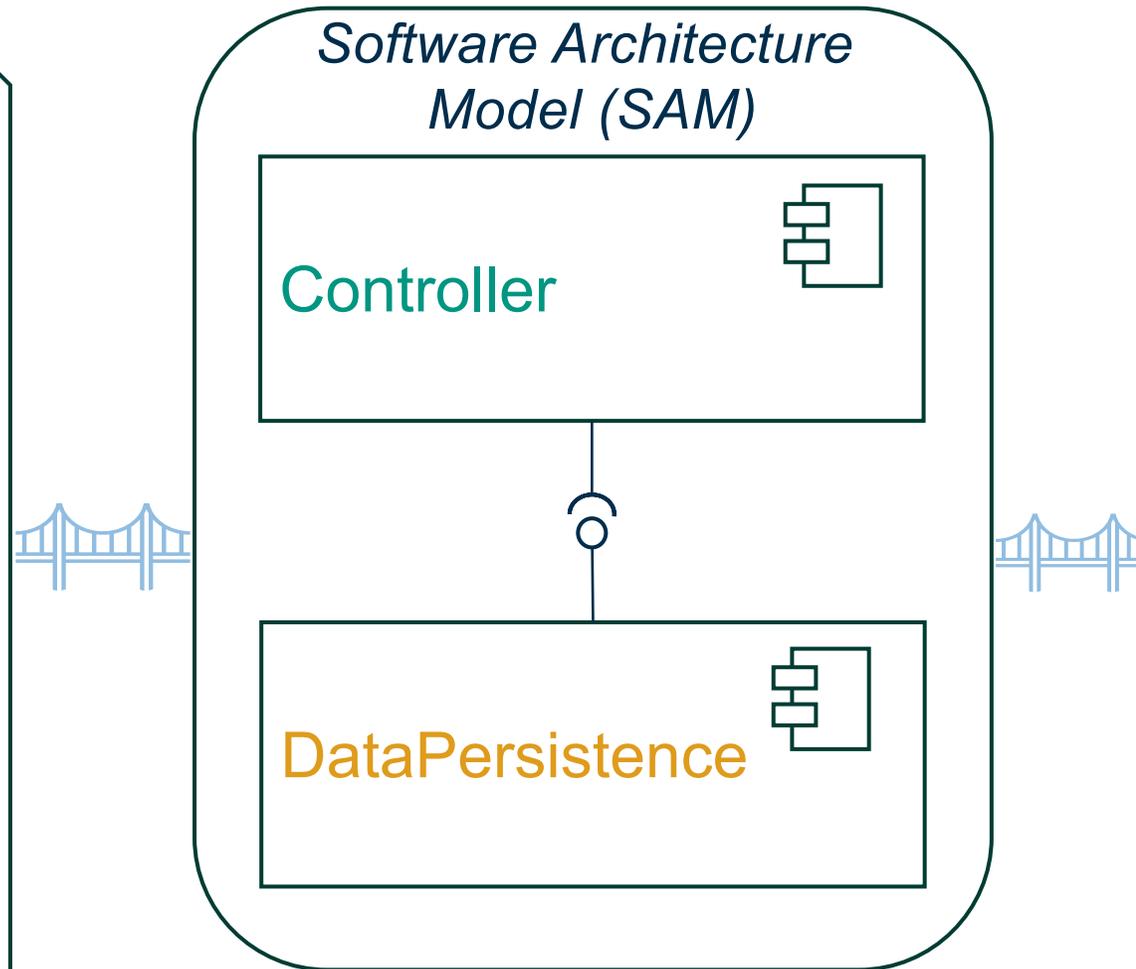

```
}
```

# Traceability Link Recovery between Documentation & Code

# Approach to get a Simple Software Architecture Model

# Approach to get a Simple Software Architecture Model

## Idea of Prompt: Documentation to Architecture

Your task is to identify the **high-level components** based on the software architecture documentation.

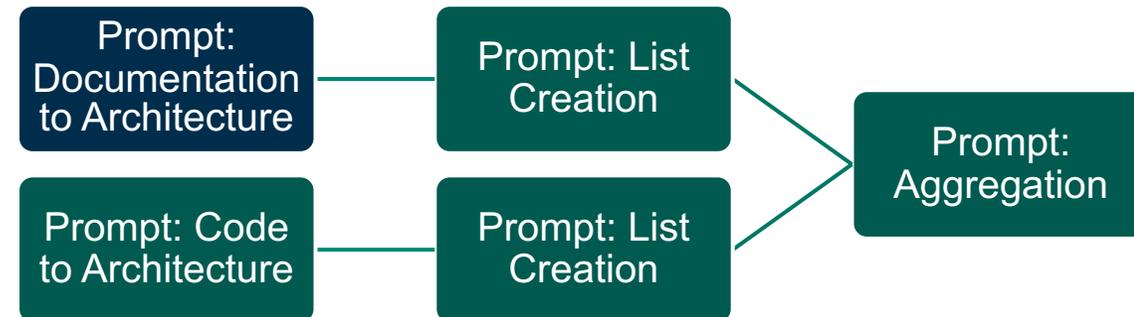

In a first step, you shall elaborate on the following documentation:  
{Software Architecture Documentation}

## Idea of Prompt: Code to Architecture

You get the **{Features}** of a software project.

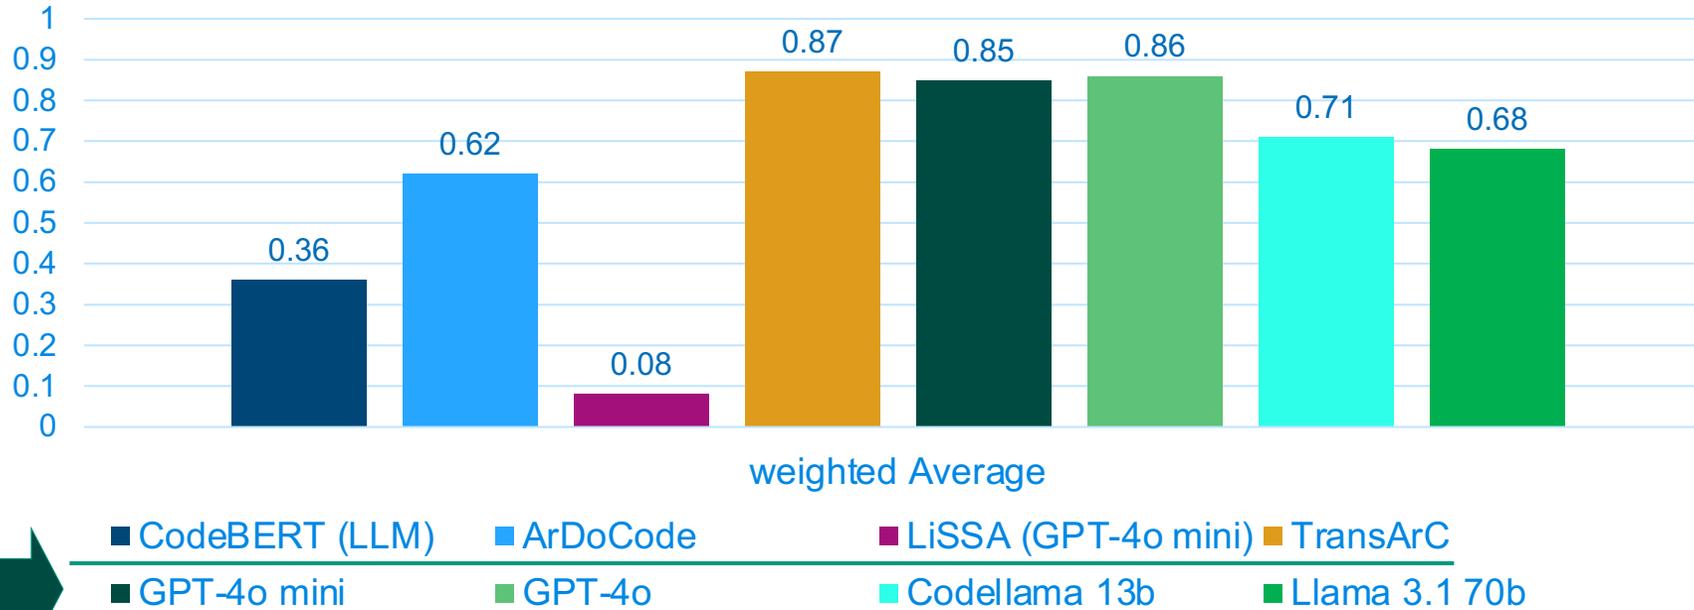

Your task is to summarize the {Features} w.r.t. the **high-level architecture** of the system.

Try to identify **possible components**. {Features}: {Content}

# Eval: Component Names derived from Documentation

F1-Score by Approach

RQ 1: Comparable to TransArC ?

RQ 2: Better than SotA w/o SAMs?

RQ 3: Open-Source vs. Closed-Source LLMs?

F1-Score: Harmonic Mean of Precision and Recall

# Eval: Component Names derived from ...

SSAM derived from ...	Average F1	Weighted Average F1
<b>Documentation</b>	<b>0.76</b>	<b>0.86</b>
Code	0.58	0.81
Both (Similarity Aggregation)	0.73	0.86
Both (Prompt Aggregation)	0.72	0.85

**RQ 1:** Comparable to TransArC ?

**RQ 2:** Better than SotA w/o SAMs?

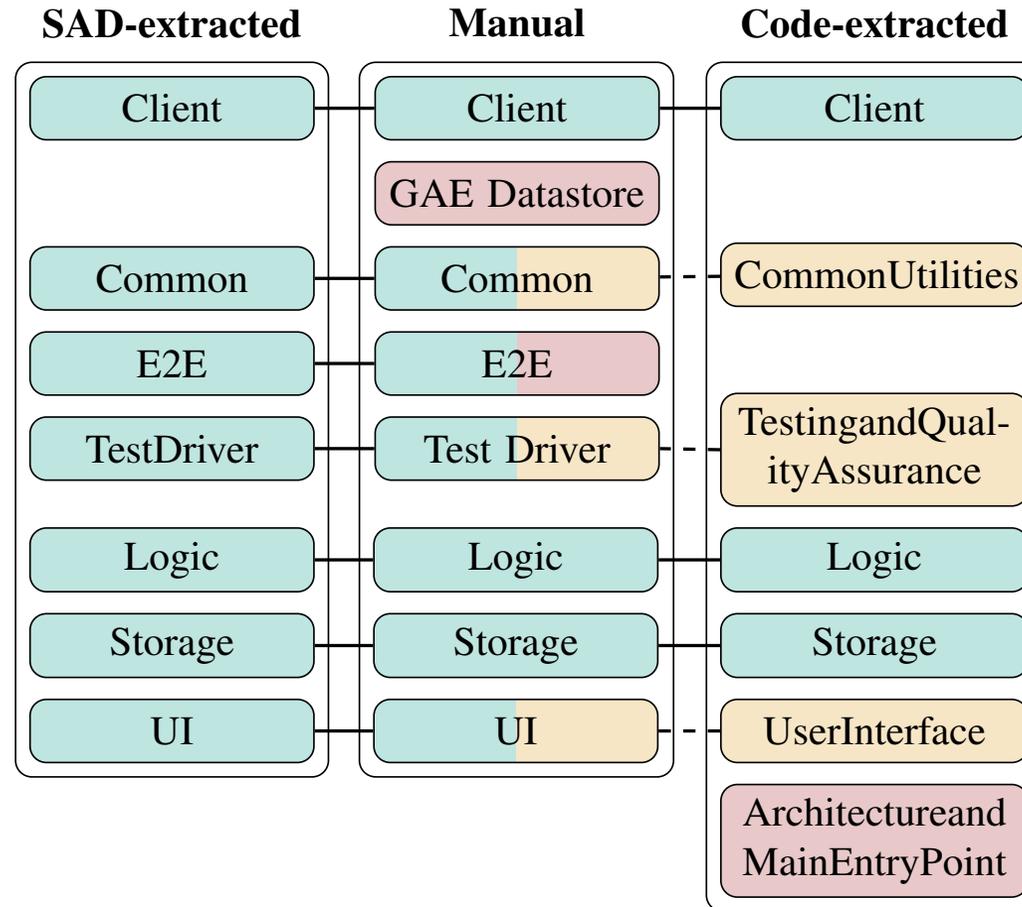

**RQ 3:** Open-Source vs. Closed-Source LLMs?

**RQ 4:** Influence of different artifacts (i.e., Code/SAD)

# Eval: Problems with LLM-extracted Simple Models

Example:

- GPT-4 Turbo
- TEAMMATES
  
- F1-Score
  - Documentation: 0.80
  - Code: 0.34

**RQ 1:** Comparable to TransArC ?

**RQ 2:** Better than SotA w/o SAMs?

**RQ 3:** Open-Source vs. Closed-Source LLMs?

**RQ 4:** Influence of different artifacts (i.e., Code/SAD)

# Conclusion

- We use LLMs to derive Simple Software Architecture Models (Component Names) to support the TLR between Architecture Documentation and Code
- In the evaluation,
  - Our approach performs comparable to TransArC (best avg. F1: 0.76)
  - Extraction based on documentation often performs better than only code (best avg. F1: 0.76 vs. 0.58)
  - Fusion (Doc + Code) can reach similar, but still less good results
- Outlook:
  - Prompt Optimization might be needed (e.g., dealing with “sub-components” in the results)
  - Analysis of the different meanings of “Trace Link”
